

Your proposal is very well written, I also like how you structured it. You do not overcomplicate your text and your reasoning (like I probably would..), making it easy to understand for the reader.

Some 'jargon' could maybe be clarified a little more. For example, when you first mention the terms 'cross-lagged' and 'autoregressive', it would be helpful if you added a short sentence explaining what they mean. I would also suggest writing out Random Intercept Cross-Lagged Panel Model the first time you mention it, with the abbreviation (RI-CLPM) in parentheses, instead of just saying RI-CLPM and explaining this some sentences later. To make these concepts easier to (quickly) understand for your readers, maybe you could consider adding a figure with an example (RI-)CLPM, so the reader immediately sees what you mean.

I really like how you start with the general aims of your research and eventually end with a research question, so the reader knows what you will be doing and why. However, it might be good to elaborate a little more about how you will estimate bias and be concrete about how you will operationalise your research question, e.g. what variables and conditions you will use.

Apart from these small clarifications, I really liked your proposal and writing style! Also, don't forget to include your student number on the front page :)
